

OACTree Sequencer

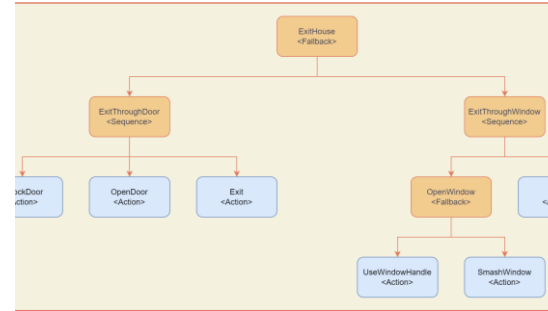

Operation, Automation and Control using Behavior Trees

Walter Van Herck, Gennady Pospelov – presented by R. Lange
EPICS Collaboration Meeting, Pohang
15-18 April 2024

Overview

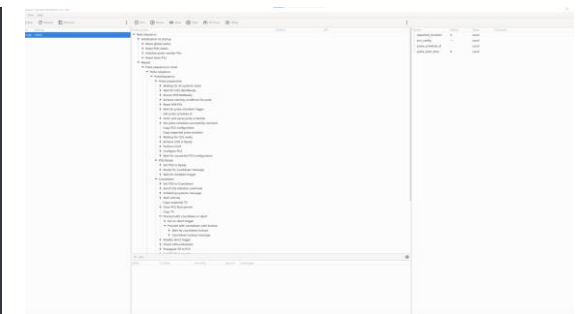

- Motivation
- Behavior tree semantics
- Extensible and composable:
 - New Instructions and/or Variables can be provided through plugins
 - Decoupled user interactions (input/output) allows for CLI, daemon, GUI, etc.
 - Include(Procedure) allows building procedures from a collection of input procedure files
- Instructions & Variables
- Plugins allow custom extensions
- GUI
- Status and Plans

```
1.0" encoding="UTF-8"?>
s="http://codac.iter.org/sup/sequencer" version="1.0"
="Procedure for testing purposes"
s:xs="http://www.w3.org/2001/XMLSchema-instance"
chemaLocation="http://codac.iter.org/sup/sequencer sequencer.xsd"

ame="Copy variables" InputVar="var1" outputVar="var2" />
fromVar="var2" description="Hello" />

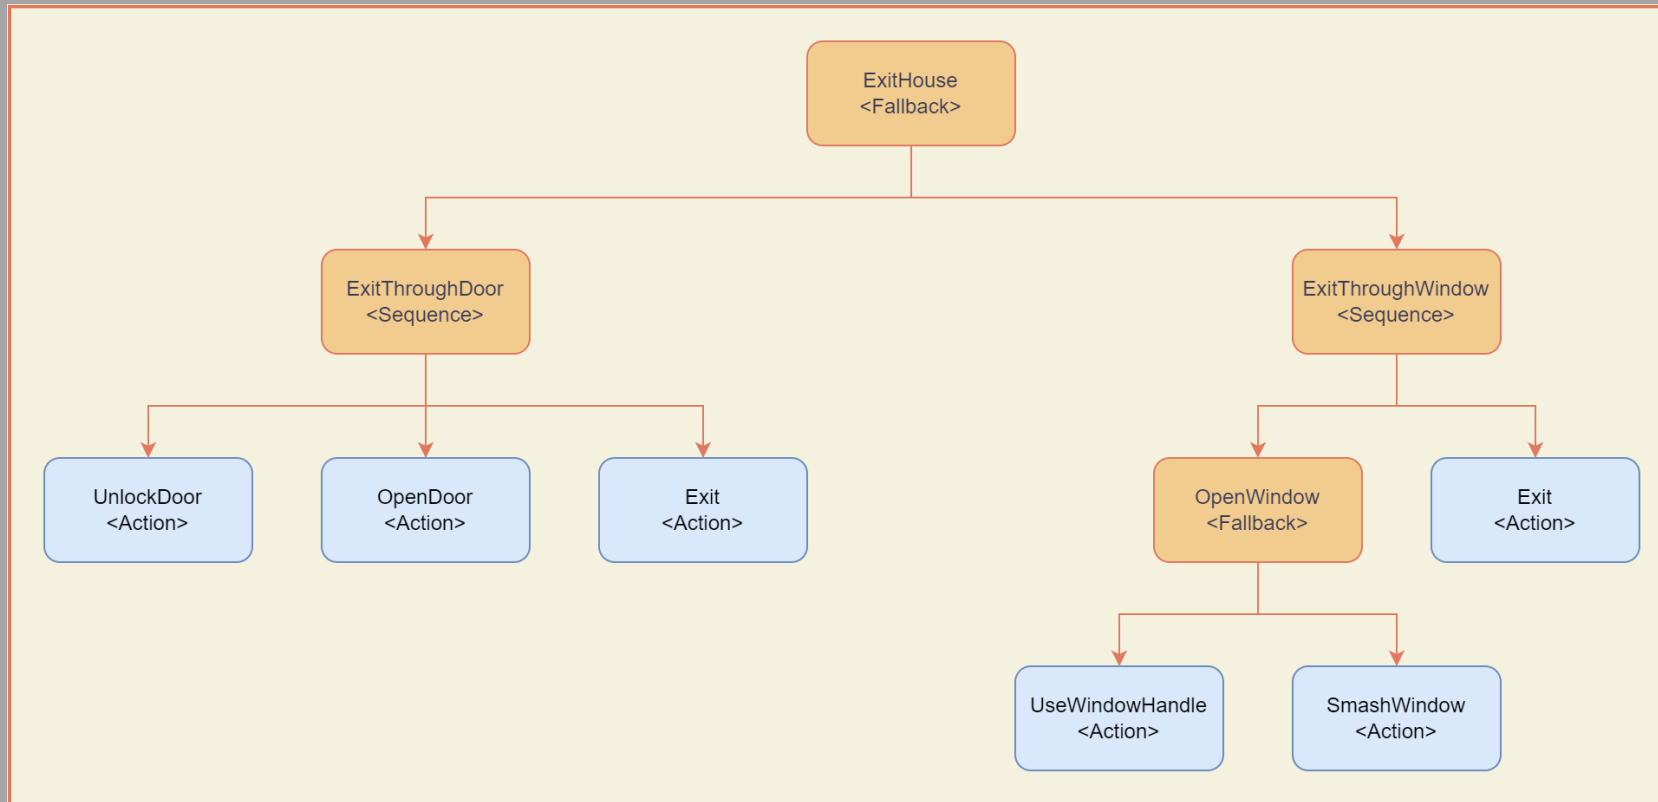

name="var1" type:{"type":"string"} value="Hello, world!" />
name="var2" type:{"type":"string"} />
>
```

Motivation

- The traditional EPICS SNC-Sequencer is a powerful tool, very well documented and tested
- ITER systems are very large and complex; often commissioned in stages
- E.g., the start-up procedure for the CC2D cooling loop (1/6) has about 1k instructions
- Finite state machines don't scale well enough
- Behavior Trees are a concept that allows for better modularization and parametrization of large procedures

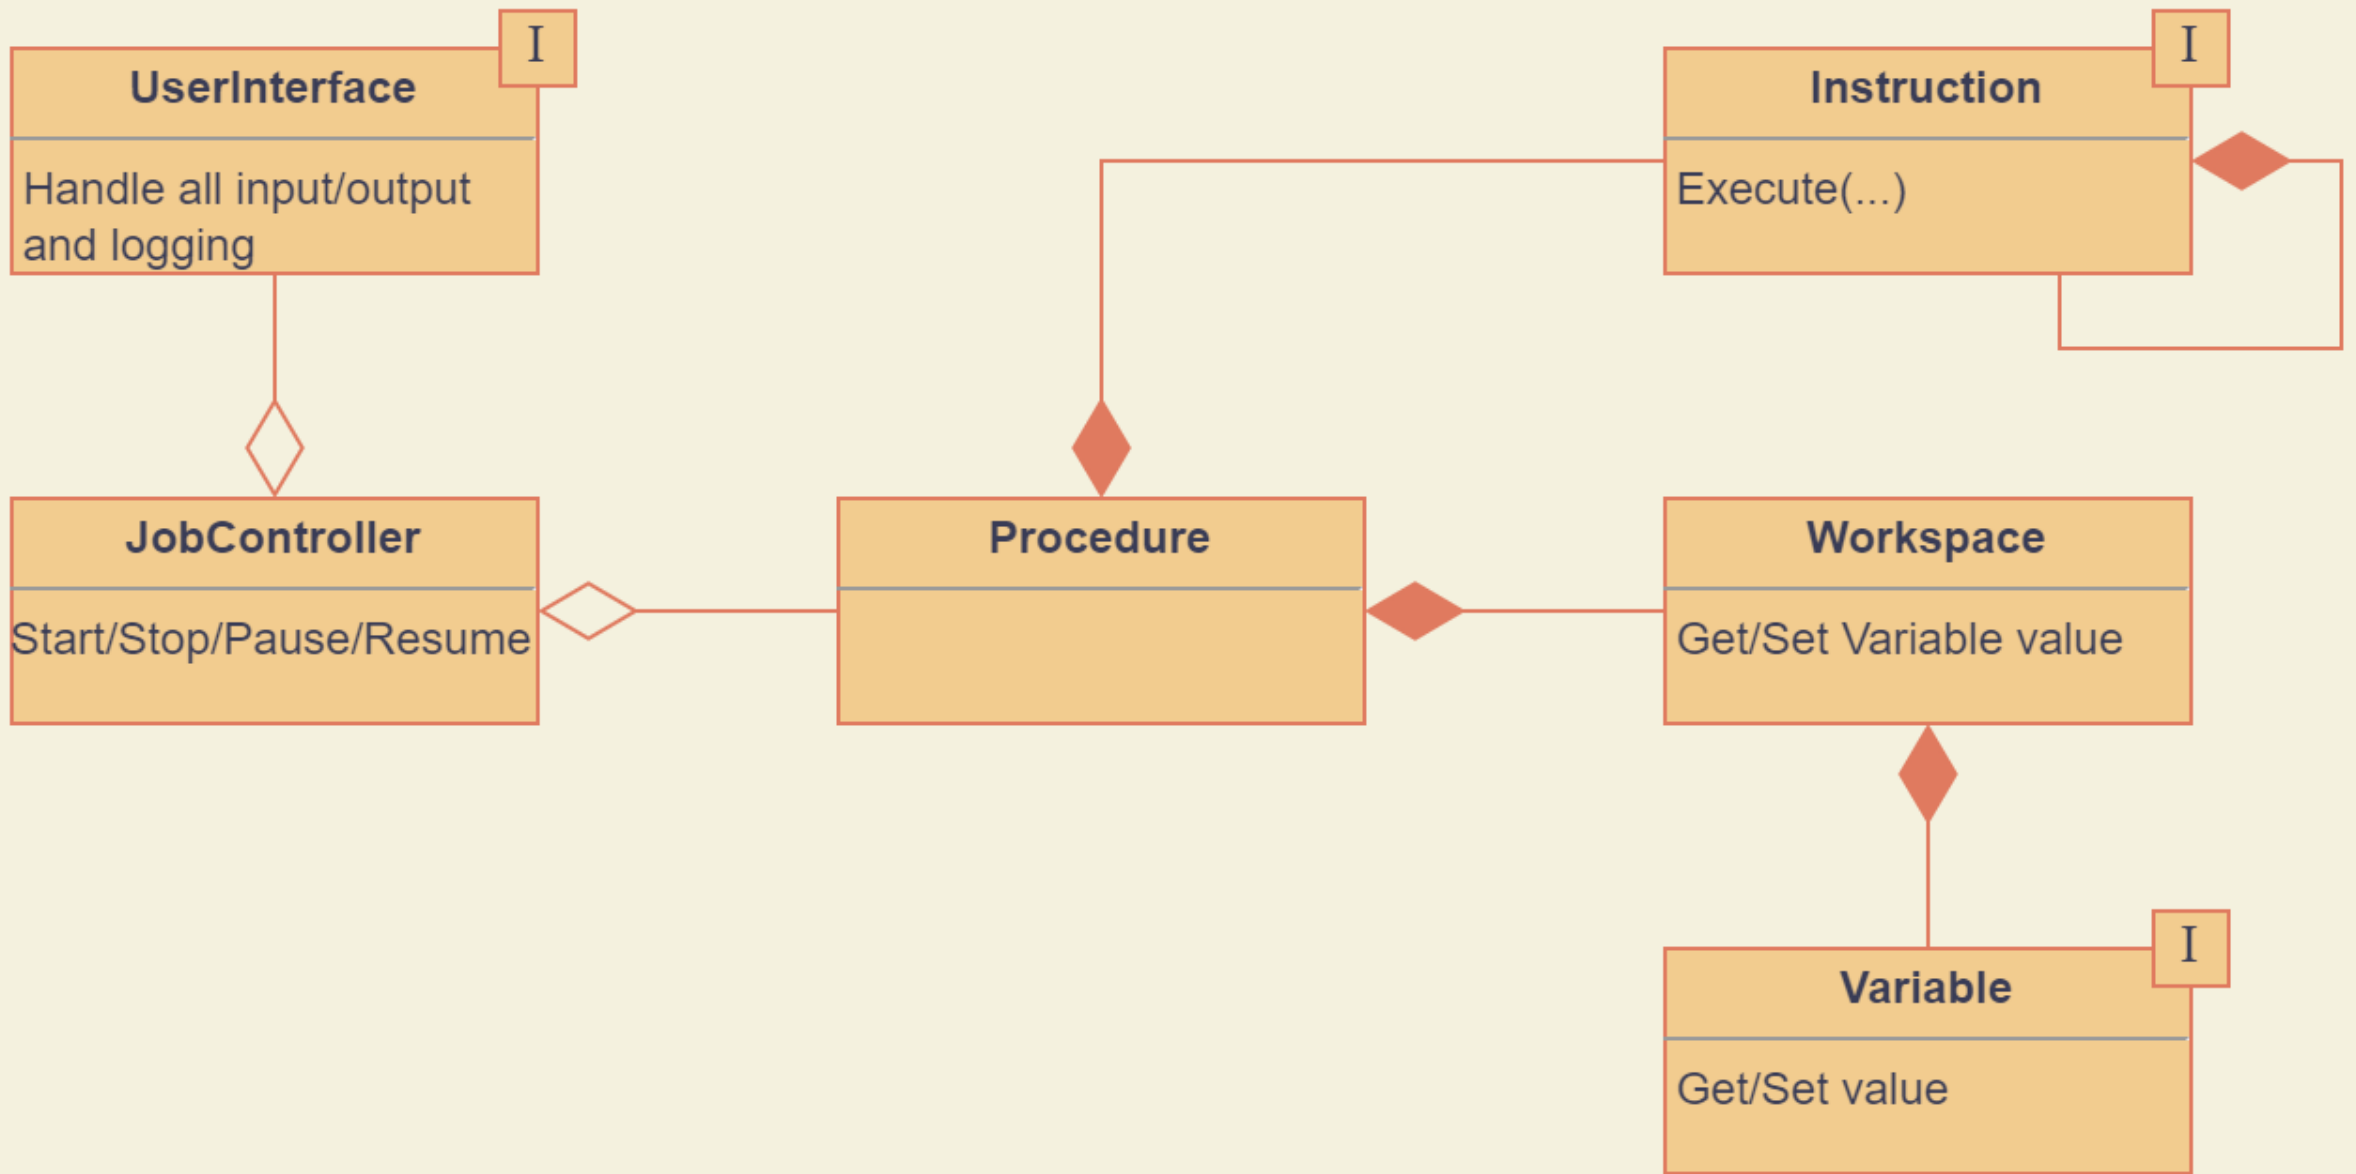

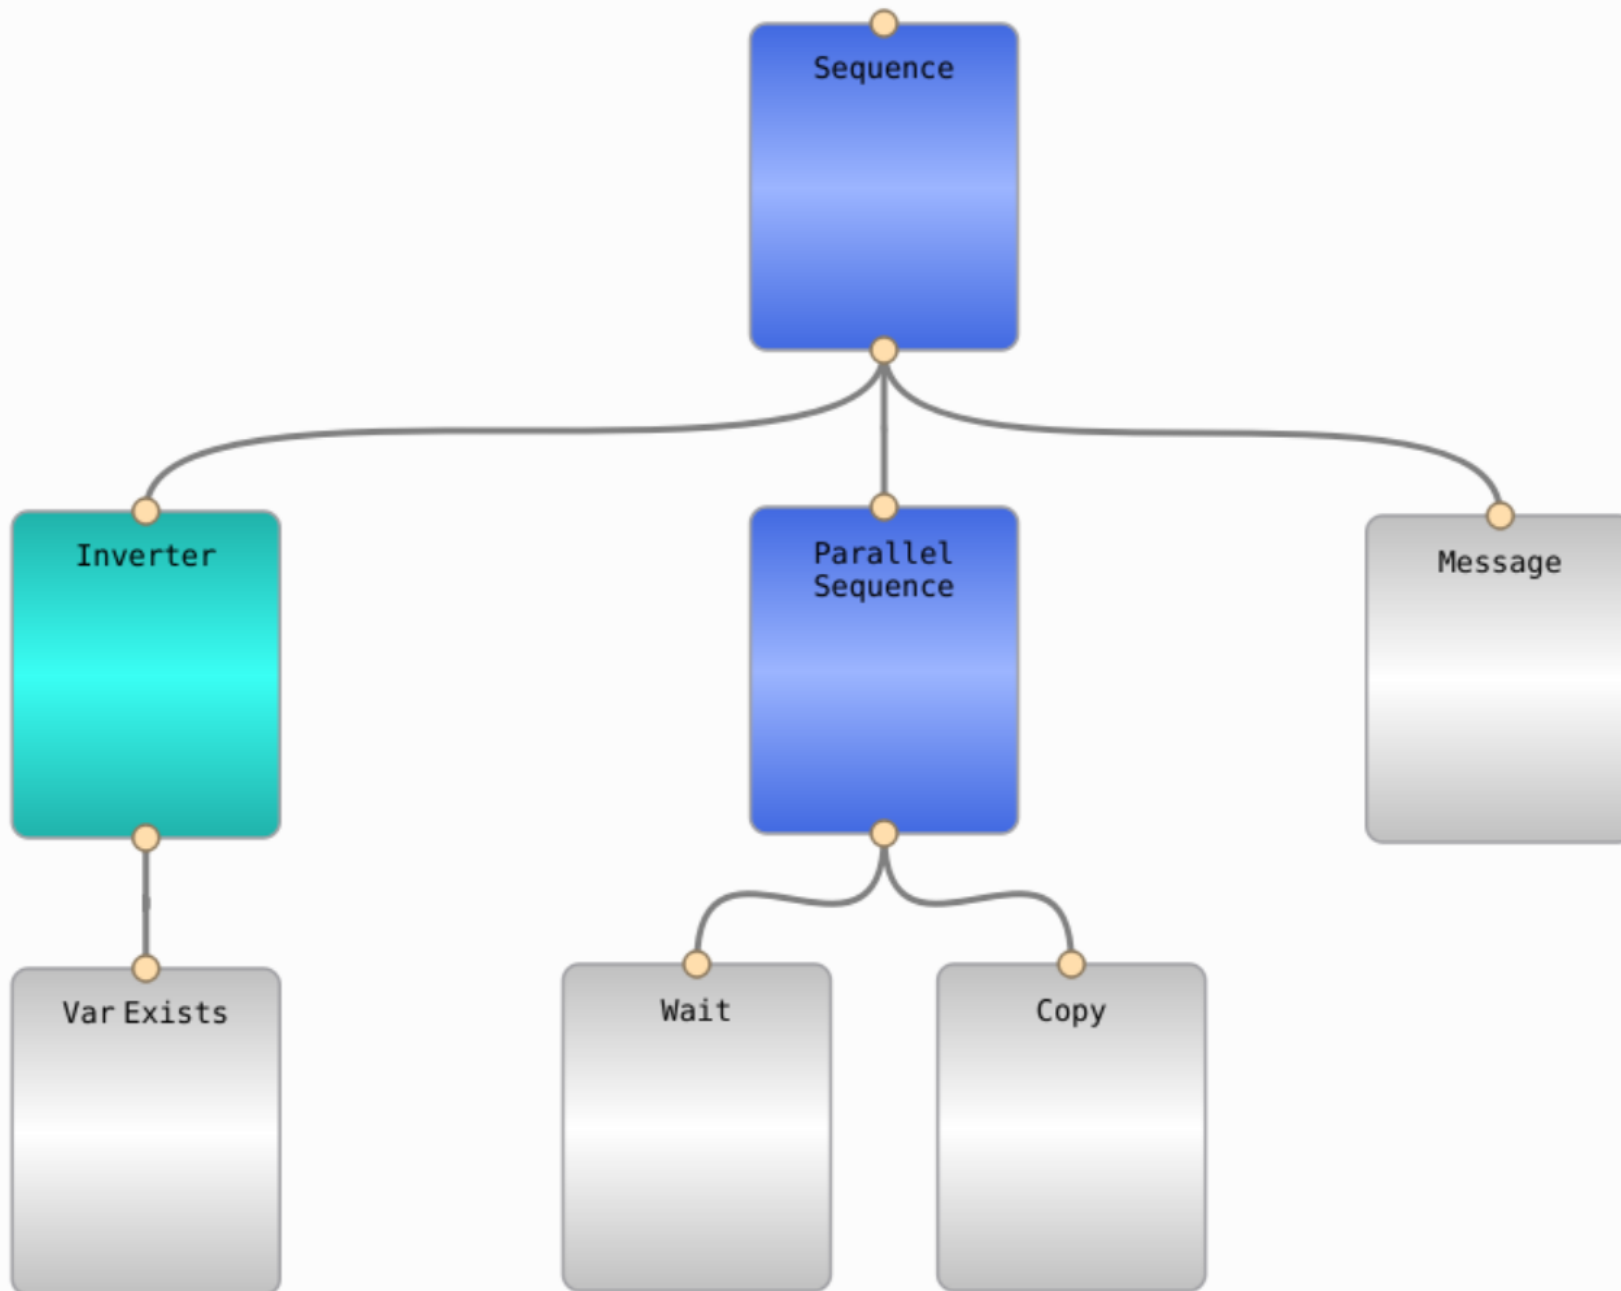

Behavior tree semantics

Goal based, rather than action based

Decompose main goal into subgoals

Used in AI, robotics, control systems and video games

Instruction categories

Composite

- Sequence
- Fallback
- ParallelSequence

Decorator

- Inverter
- Listen
- Include(Procedure)

Action

- Wait
- Copy
- Output
- Input

Workspace variables

Procedure-scoped workspace of variables

```
<?xml version="1.0" encoding="UTF-8"?>
<Procedure xmlns="http://codac.iter.org/sup/sequencer" version="1.0"
  name="Procedure for testing purposes"
  xmlns:xs="http://www.w3.org/2001/XMLSchema-instance"
  xs:schemaLocation="http://codac.iter.org/sup/sequencer sequencer.xsd">
  <Sequence>
    <Copy name="Copy variables" inputVar="var1" outputVar="var2" />
    <Output fromVar="var2" description="Hello" />
  </Sequence>
  <Workspace>
    <Local name="var1" type='{ "type": "string" }' value='"Hello, world!"' />
    <Local name="var2" type='{ "type": "string" }' />
  </Workspace>
</Procedure>
```

Plugins

New instructions and variables can be added with the use of plugins.

Current plugins:

- **sequencer-plugin-control** : composite instructions that are common in control systems
- **sequencer-plugin-epics** : read/write process variables; RPC client; supports both ChannelAccess and PvAccess
- **sequencer-plugin-mathexpr** : exposes sup-mathexpr to sequencer
- **sequencer-plugin-sup** : for configuration reading/writing and calling CVVF functions
- **sequencer-plugin-psps** : provides interface to pulse schedule database

Status

Initial

Instruction Status BP

- ▼ Root sequence
 - ▼ Initialization at startup
 - ▶ Reset global states
 - ▶ Reset POS states
 - ▶ Initialize pulse number PVs
 - ▶ Reset timer PVs
 - ▼ Repeat
 - ▼ Pulse sequence or reset
 - ▼ Pulse sequence
 - ▼ PulseSequence
 - ▼ Pulse preparation
 - ▶ Waiting for all systems reset
 - ▶ Wait for COS (Not)Ready
 - ▶ Ensure POS NotReady
 - ▶ Achieve starting conditions for pulse
 - ▶ Reset HMI PVs
 - ▶ Wait for pulse schedule trigger
 - Get pulse schedule id
 - ▶ Fetch and parse pulse schedule
 - ▶ Set pulse schedule successfully received
 - Copy PCS configuration
 - Copy expected pulse duration
 - ▶ Waiting for COS ready
 - ▶ Achieve COS is Ready
 - ▶ Perform CVVF
 - ▶ Configure PCS
 - ▶ Wait for successful PCS configuration
 - ▼ POS Ready
 - ▶ Set POS to Ready
 - ▶ Ready for countdown message
 - ▶ Wait for Go/Abort trigger
 - ▼ Countdown
 - ▶ Set POS to Countdown
 - ▶ Send COS Initialize command
 - ▶ Initializing systems message
 - ▶ Start activity
 - Copy expected T0
 - ▶ Clear PCS final permit
 - Copy T0
 - ▼ Proceed with countdown or abort
 - ▶ Fail on abort trigger
 - ▼ Proceed with countdown until lockout
 - ▶ Wait for countdown lockout
 - ▶ Countdown lockout message
 - ▶ Disable abort trigger
 - ▶ Check COS Initialized
 - ▶ Propagate T0 to PCS

| Name | Value | Type | Channel |
|-------------------|-------|-------|---------|
| expected_duration | 0 | Local | |
| pcs_config | --- | Local | |
| pulse_schedule_id | | Local | |
| pulse_start_time | 0 | Local | |

LOG

| date | time | severity | source | message |
|------|------|----------|--------|---------|
| | | | | |

Status and Plans

Core libraries:
Complete and in
maintenance mode

Plugins:
Depends on the plugin.
EPICS Plugin needs more
testing.

GUI:
Stable, still needing UX
improvements

Next:
Remote Sequencer Servers to
allow running procedures
continuously

Availability:
Currently still under ITER IP
rules...
Please contact us !!

Thank you!

OACTree Sequencer
